**Final Project Manual Test Plan (Week 1)**

1. Run the app, on the start screen you should see the location (currently coded to always show Champaign, IL), the temperature at that location in Fahrenheit and the precipitation conditions.

2. Make sure that the temperature and weather actually match what you expect to see at the displayed location.

3. Pressing on the Settings button should take you to a placeholder settings screen such as this one:

4. Pressing on the upper left back arrow should take you back to the previous screen.

5. Pressing the refresh button should cause the weather data to update (given that enough time has passed for there to be new data available).
